Street Lighting and Equity

PBOT Strategic Plan

Equity Analysis Dashboard

Street Lighting

Crosswalks and Traffic Signals

# Street Lighting History

In 1912, the Greater Portland Plan stated:

*“Portland is second to no city in the world in the matter of street lighting”*

In 1925, the ornamental street lighting program was launched

In 1956, Portland celebrated Mercury Vapor street lighting being installed

- Affordable Housing Pipeline

Equity Matrix | Equity + Inclusion | The City of Portland, Oregon

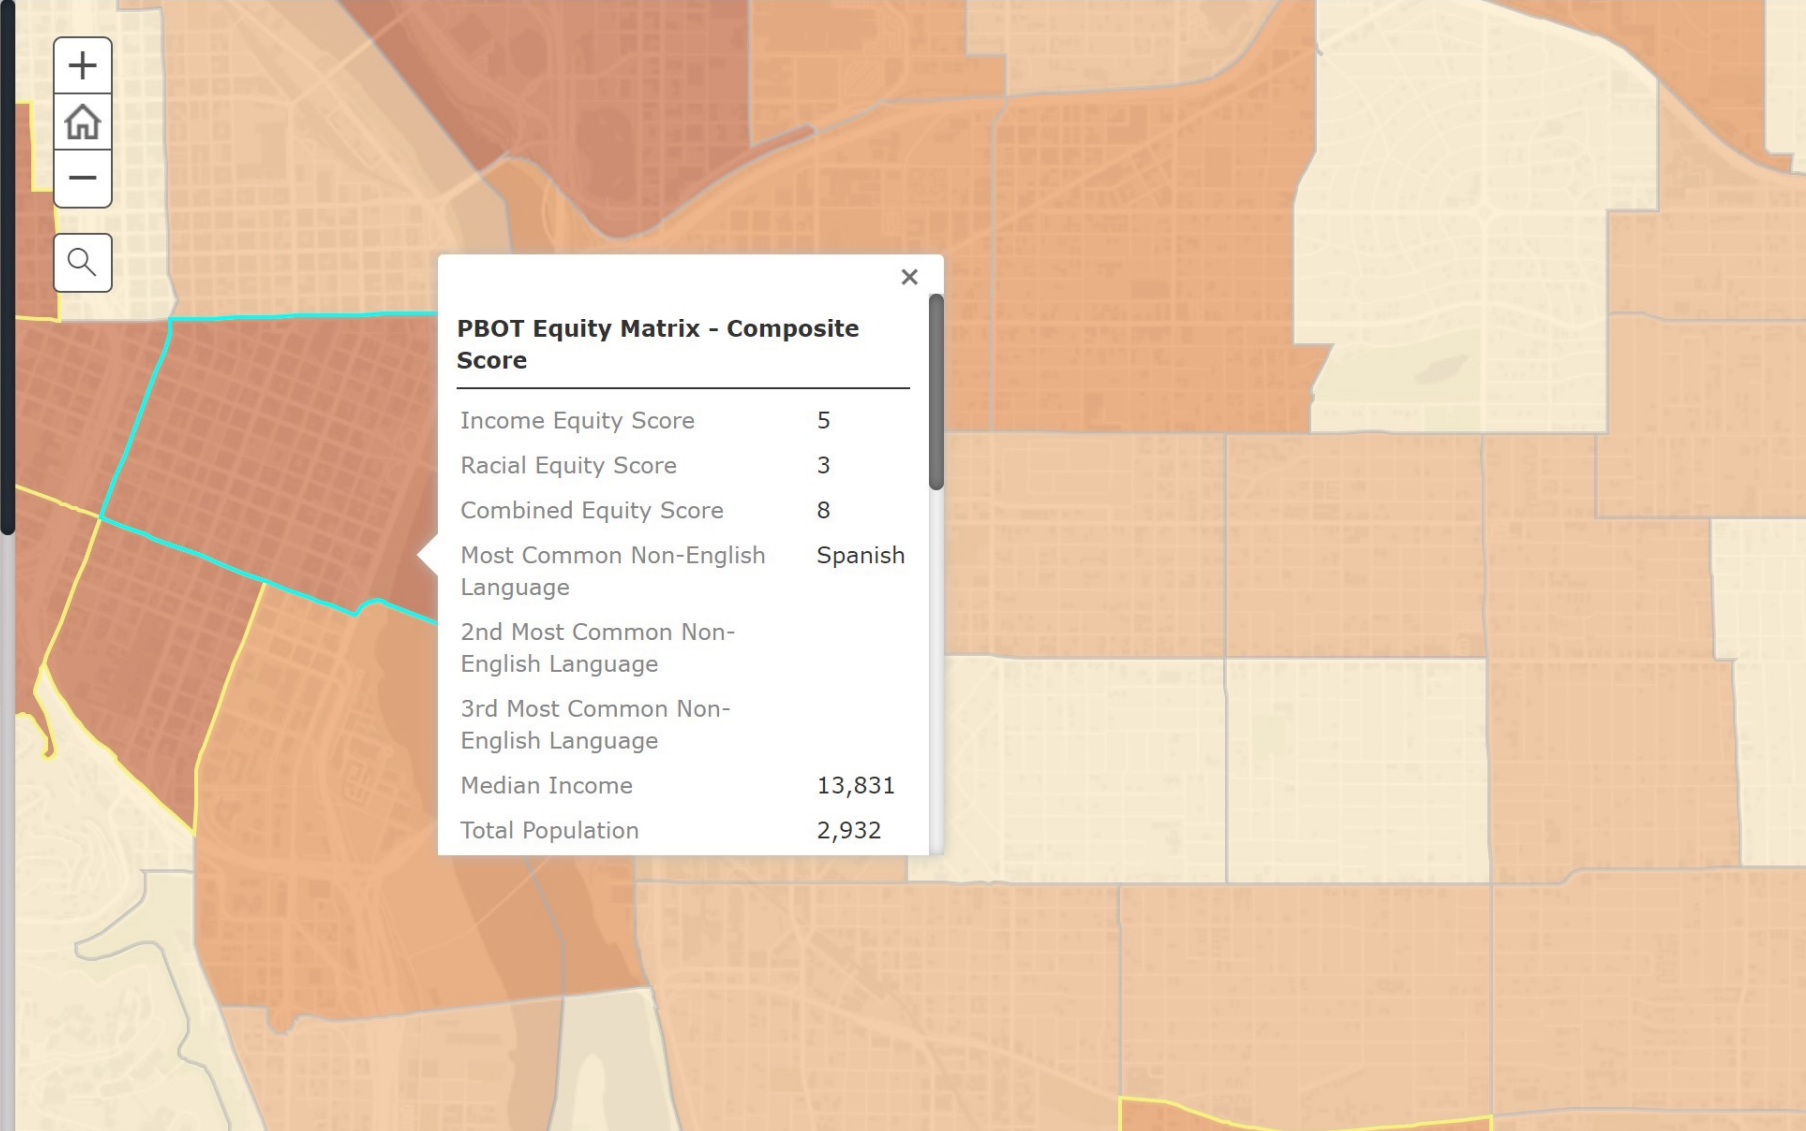

## PBOT's Equity Matrix

To inform our work, guide our investments and work to achieve the Citywide Racial Equity Goals and Strategies, PBOT has created a simplified version of an **Equity Matrix**, or equity ranking index, that can be used to help rank many of our internal lists that relate to projects, programs and even procedures.

PBOT has standardized an **Equity Matrix** based on national best practices, so that moving forward we can have more consistency in how we use an equity matrix, and what the equity matrix measures.

National best practice and the City's Office of Equity and Human Rights say to use only three demographic variables in an equity matrix: **Race**, **Income**, and **Limited English Proficiency (LEP)**. LEP was not included in the calculation of the matrix due to a relatively high level of uncertainty and error in the underlying data. Instead, Census Tracts with higher than citywide average populations with LEP are outlined on the map.

Racial categories and the percentage of the population that identifies as Hispanic/Latino were estimated separately by the US Census Bureau. The numbers in the racial population categories may not add up to the total number of people of color used to calculate the Racial Equity Score.

# Equity in Street Lighting

---

Considered the perspective of equity in how to deliver a Citywide LED program

Measured rollout to prioritize areas within census tracts

## Inclusion of Equity in an LED Citywide Street Lighting Replacement Program

BY PETER KOONCE, P.E.

**E**quity is a topic that's emerging in cities across the United States. As cities become more racially, ethnically, and age diverse, transportation practitioners should evolve practices that consider the needs of the community. Like other cities, there are

# Walking While Black

---

PORTLAND'S CITYWIDE  
PEDESTRIAN PLAN

Places to Improve - Average Point Value (from 1-6)

WHAT MAKES WALKING DIFFICULT IN PORTLAND?	WALKING WHILE BLACK	CITYWIDE
Poor Lighting	5.00	3.62
Sidewalks / walking paths missing on BUSY Streets	4.94	4.66
People driving too fast on BUSY streets	4.82	4.29
Not enough safe places to cross busy streets	4.78	4.46
People driving too fast on RESIDENTIAL streets	4.74	4.44
Sidewalks / walking paths missing on RESIDENTIAL streets	4.71	4.29
Drivers not stopping for pedestrians crossing the street	4.47	4.29
Buckled / cracked / uplifted sidewalks, or other tripping hazards	4.47	3.46
Missing curb ramps at intersections	4.00	3.22
Not enough time to cross the streets	3.91	3.08

Figure 1. Which kinds of places are the most important to improve for walking in Portland?

# Moving to Our Future

PBOT's Strategic Plan  
2019-2022

# PBOT Strategic Plan

Will it advance equity and address structural racism?

Will it reduce carbon emissions?

# Street Lighting Knock Downs

Is our response time influenced by neighborhood?

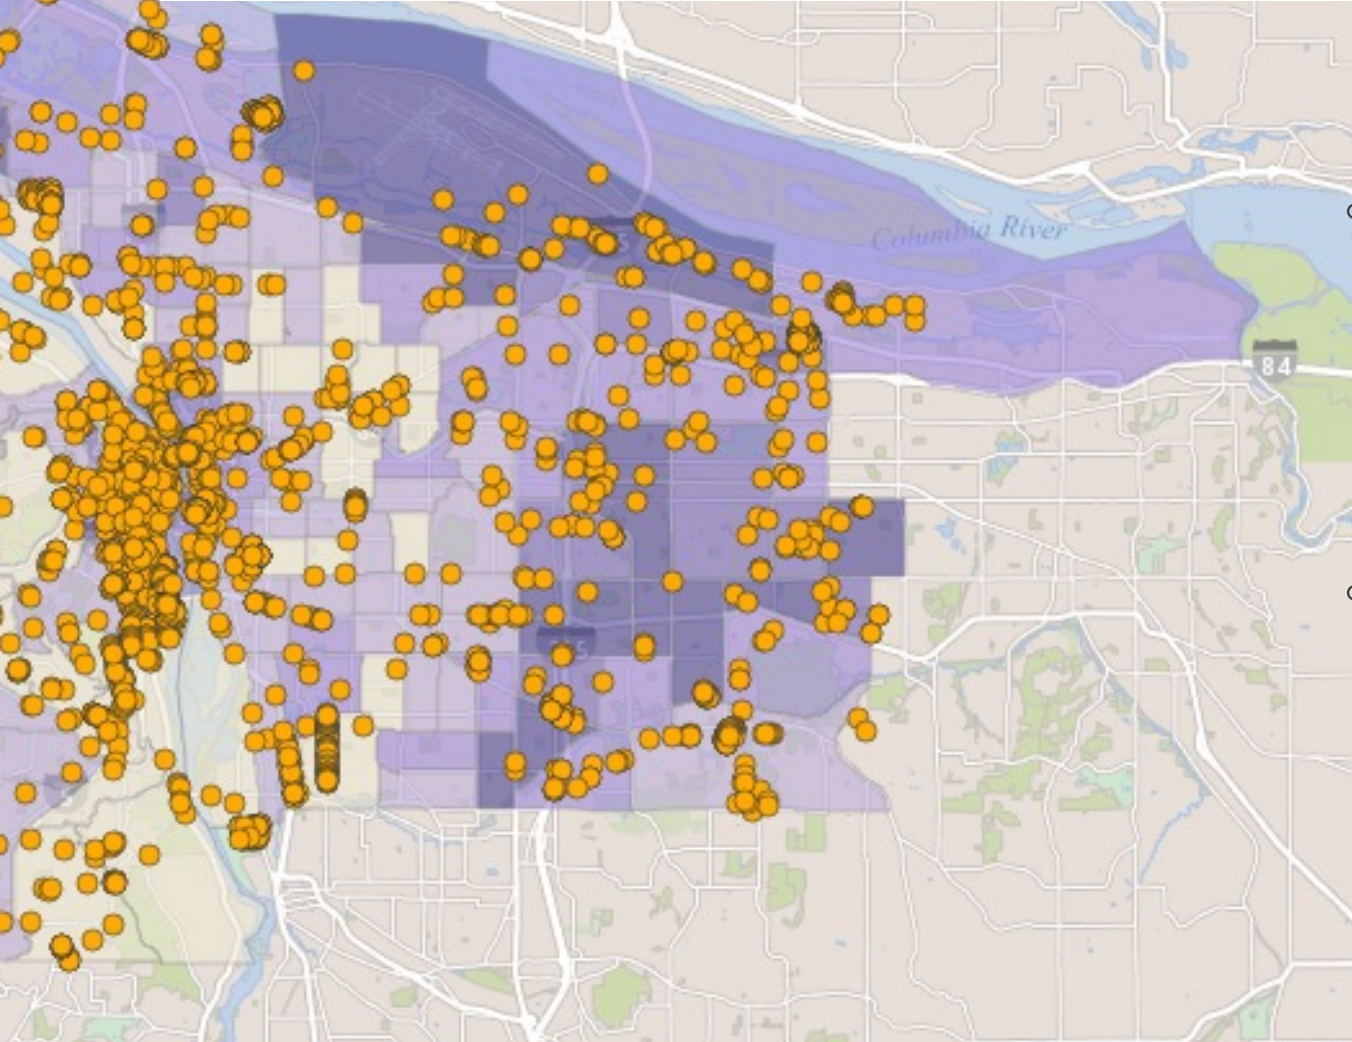

Why Aren't Cities Doing  
This Already?

---

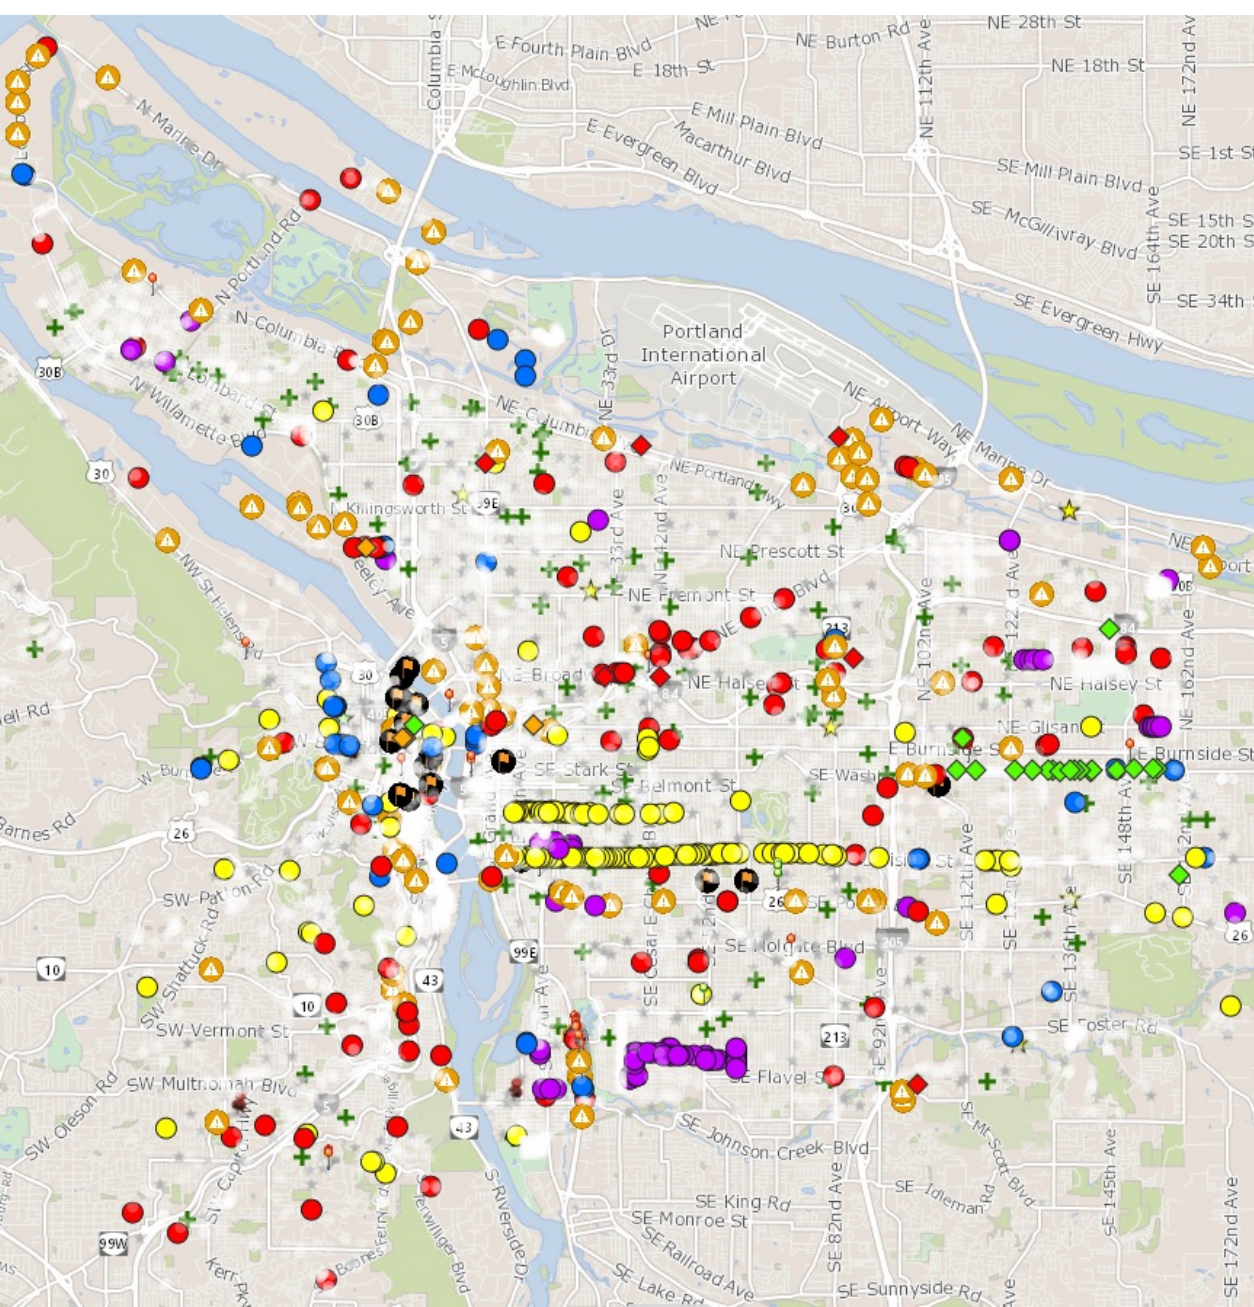

# Why are we working on SLRP Tracking?

- **Implementation of strategy**
  - Use time & equity score to determine scheduling
  - We need good data and reporting to eliminate/decrease disparities
- **Ensure accountability and help communicate and evaluate the results**

Completed SLRP Items & Equity Matrix Score

# High vs Low Equity Score

---

EQUITY SCORE 6-10

EQUITY SCORE 2-5

# Issues with the Data

---

Organized by Census Tract

Issues with age of infrastructure

Precision of Equity Score

# Street Lighting Investment & Equity

# Special District Lighting

Every unique fixture associated with street lighting offers substantial costs for PBOT

Ped scale Street Lighting fixture: \$1,400

Wood pole (cobra head) fixture: \$250

# Bright Ideas for Street Lighting

---

## Innovate to reduce costs

- LED Street Lighting upgrades
- Developer requirements

## The Costco approach: Only stock so many products

- Reduce number of fixtures and different poles where possible
- Reduce trend of increasing amount of pedestrian scale districts (lower cost ped scale options?)

## Measure what Matters

- Equity focused approach
- Reduce response times by managing other “optional” work

# Subtle Bias in Driver Yielding Behavior at Crosswalks

Dr. Kimberly Barsamian Kahn  
Portland State University

# Collaborators

- Tara Goddard, Ph.D.
  - *Texas A&M*
- Arlie Adkins, Ph.D.
  - *University of Arizona*
- Jean McMahon, Ph.D.
  - *Portland State University*

# Pedestrian experiences at crosswalks

- Potential point of conflict with drivers
- Racial minorities overrepresented in pedestrian fatalities (CDC, 2013)
- Are racial minorities being treated differently by drivers at crosswalks?

# Drivers' treatment of pedestrians

- Drivers treat pedestrians differently
  - High-status cars are less likely to yield than low-status cars (Piff et al., 2012)
  - More likely to yield to people in own age group (Rosenbloom, Nemrodov and Ben Eliyahu, 2006)
  - More likely to yield to disabled individuals (Harrell, 1992)

## What about race?

- May reflect implicit biases, subtle discrimination
- Face paced, discretion, distraction

# Study 1: Drivers' treatment of pedestrians by race

- Controlled field experiment in downtown Portland
  - 2 lane, one way street, downstream from stop light
  - Marked zebra stripe crossing pattern
  - Off peak hours, morning and afternoon
  - Clear visibility
- Pedestrians:
  - 3 White males, 3 Black males, mid 20 yrs old
  - Standardized appearance, similar build/height
  - Trained in crossing procedure
- Trained coders recorded outcomes of crossing trials

# Field Experiment: Trials

- Trial began when first car from traffic light change hit designated spot
- Pedestrian approach edge of crosswalk, intent to cross
- Trial ended when:
  - 1) car clearly yielded
  - 2) entire platoon passed without yielding
- Pedestrian crossed and next cued when out of sight
- Pedestrians given randomized order, crossed individually

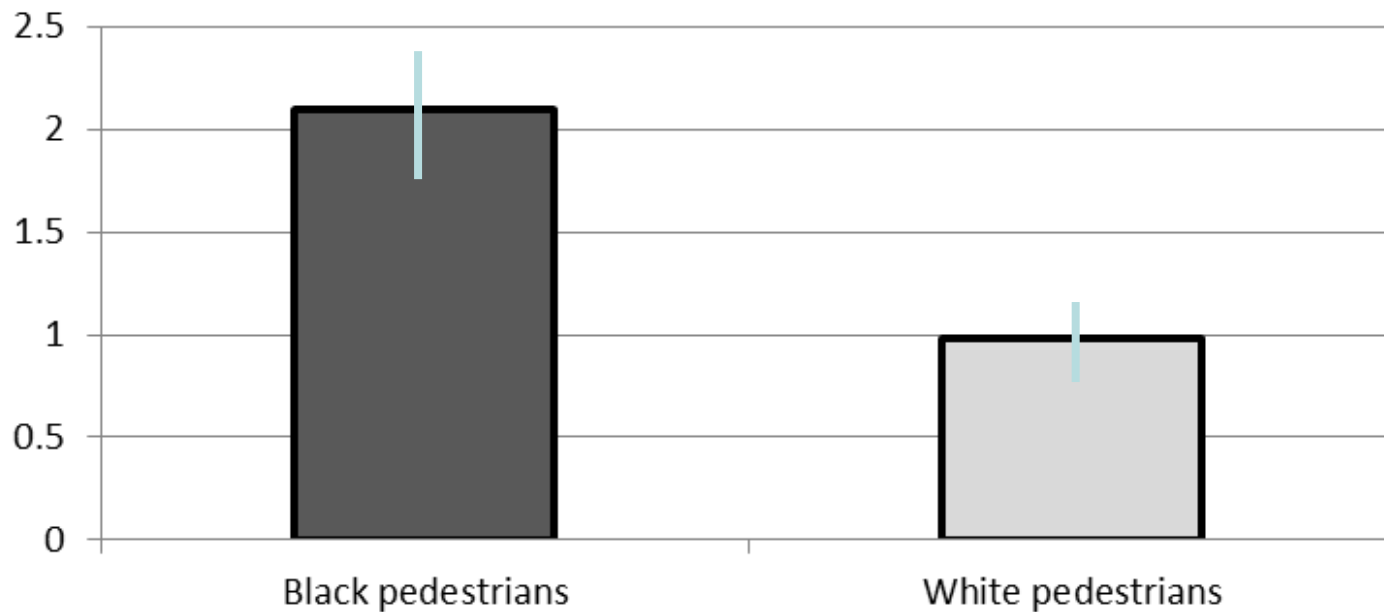

# Study 1 Field Experiment

- 88 trials, 173 Driver subjects

# Study 1 Results

Average number of cars that passed without stopping

**Black pedestrians passed by more than twice as many cars (2.02 to .98)  $F(1,87)= 5.95$ ,  $p= .017$**

# Study 1 Results

**Black pedestrians waited 32% longer (9.79 to 7.40)  $F(1,87)= 5.31$ ,  $p= .02$**

# Study 2 & 3: Field Experiment

- Twice at new location:
  - 2 lane, one way road
  - Before and after city marked crosswalk at intersection
- Race and gender of pedestrians
  - 12 pedestrians/study: 3 Black men, 3 White men, 3 Black women, and 3 White women

# Field Experiments 2 and 3

- Afternoon, off peak trials
- 319 Trials in Study 2, 409 trials in Study 3

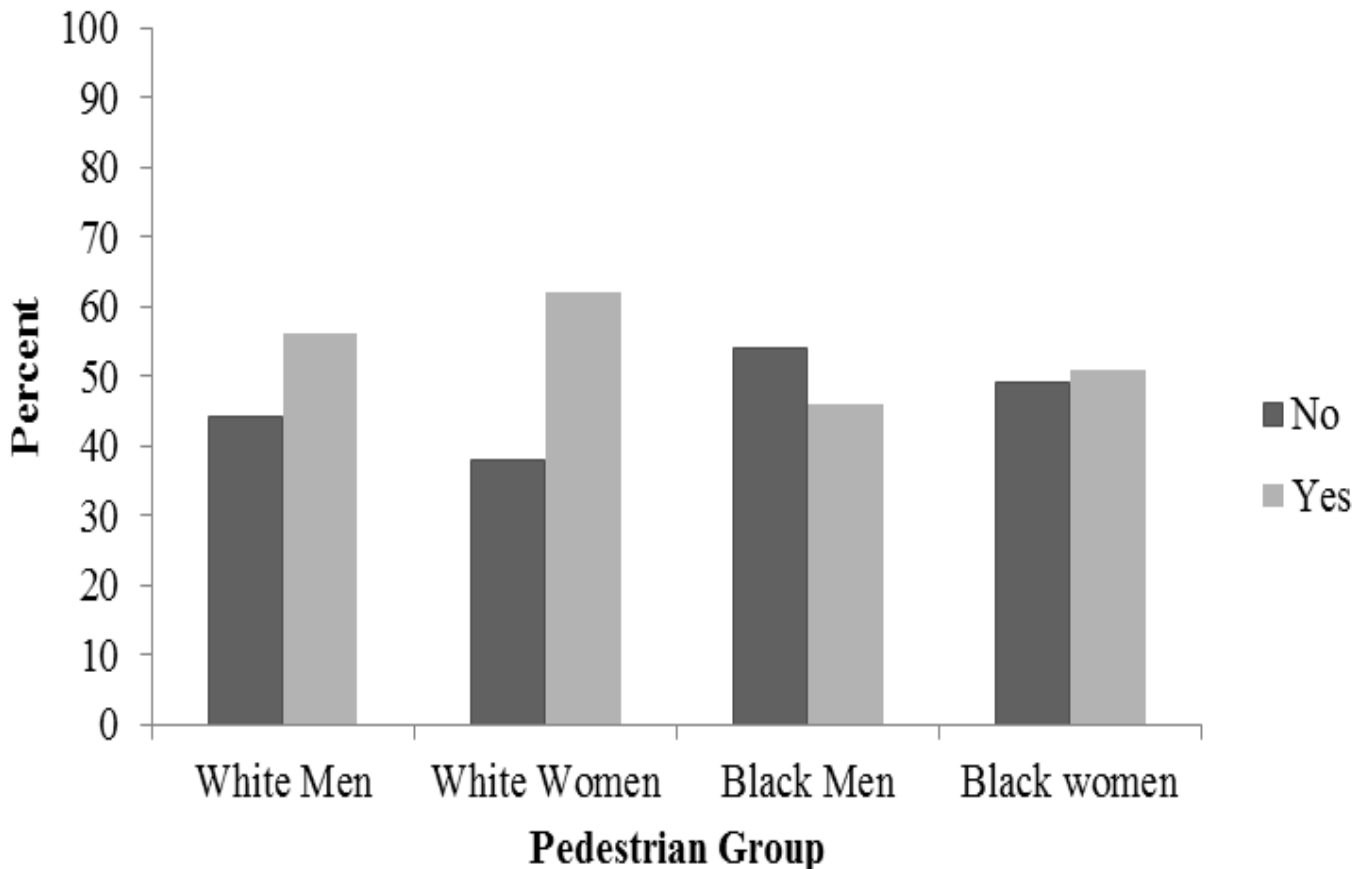

# Study 2 Results: Unmarked crosswalk

- Overall low stopping rates
  - 18% of trials in which any car stopped, 2.8% first car stop
- Drivers did not differentiate among Black and White men and women at the unmarked crosswalk

**Study 3:** Same crosswalk after receiving markings  
12 new Black/White male/female pedestrians\*  
First car stopped on 208 out of 380 trials (55%)

# Study 3 Results: First Car Stop

## First car stop (marked crosswalk)

- $\chi^2(3, N=380) = 6.25, p=.10$

**More likely to stop for Whites than Blacks (59% to 49%)**  $\chi^2(1, N=378) = 3.87, p=.05$ .

**More likely to stop for females than males (61% to 51%)**  $\chi^2(1, N=378) = 4.06, p=.04$

**Most likely to stop for White Women, least likely for Black men**

# Study 3 Results: Cars Passed

## Cars Passing Without Yielding (marked crosswalk)

- Race\*Gender interaction:  $F(1, 373) = 2.99$ ,  $p = .09$
- **Black men had more cars passed than Black women ( $M = 2.05$  to  $M = 1.19$ ),  $t(128.59) = -2.30$ ,  $p = .02$ .**

# Study 3 Results: Stop Bar

*Stop bar:* coded as before or after

- Before the stop bar: obeying signage, more space to cross
- After the stop bar: closer to pedestrian, infringing on crossing space

# Study 3 Results: Stop Bar

Stop bar (marked crosswalk)

- $\chi^2(3, N=381) = 21.56, p < .001$
- **Black males & Black females: more likely to stop *after* bar**
- **White males & White females: more like to stop *before* bar**

# Focus group themes: Black pedestrians

- Black participants reported that their interactions with drivers were perceived to be affected by race.

*“I will come to an intersection on one side and waiting because there’s cars, and then as soon as a white person steps on the other side, oh, car stops. I’m like, this is magic, what’s going on? It was you. It wasn’t me.”*

# Focus group themes

Participants noted the stress caused by these racially charged interactions.

*"I think it's stressful. It's just an added stress to your commute whenever—even when it's a leisurely commute. Stuff like that it's, like, you just have to, you know, I guess, just part of the black experience of being more aware and cautious of everything that we do."*

# Overall findings & recommendations

- Marking crosswalks effective in increasing stopping
  - But also unequitable stopping
- Reducing perceived discretion in stopping may increase stopping rates for all pedestrians
  - Additional signage, flashing lights
- Consider equity impact in planning

# Thank you!
