ABSTRACT

Program evaluation is in its infancy at the Washington County Mental Health Program; it is only within the last two years that there has been any emphasis placed on evaluation activities. The first chapter in this practicum will identify and provide a context for the recent introduction of the management by objectives approach to process evaluation within the Washington County Mental Health Program as well as present a rationale for such an approach; the second chapter in this practicum is a presentation of results obtained from the first follow-up study to employ management objectives as an evaluation tool; the third chapter explores problems inherent in the nature and design of this type of evaluation procedure as well as program implications concerning the utility of results obtained from the study and recommendations for change in both approach and procedure.

WASHINGTON COUNTY MENTAL HEALTH PROGRAM YEAR END REPORT FOR FISCAL YEAR 1976-1977

CHAPTER I

INTRODUCTION

At the present time, evaluation activities, occurring within the Washington County Mental Health Program, are performed by administrative core staff members, private consultants, and directors of individual service providers (subcontract agencies). The evaluation efforts relate strictly to process objectives; outcome evaluation is virtually nonexistent. Needs assessments are few; for the most part evaluation focuses on services provided to clients who have already been identified and currently participate in the formal mental health system. Needs assessments and utilization studies, encompassing the bulk of current program evaluation efforts, are most frequently undertaken by agents outside of the service-providing agency.

Fiscal year 1976-1977 marked the beginning of a major revision in evaluation and program accountability for the Washington County Mental Health Program. Each year administrative staff members construct a Comprehensive Mental Health Plan; this plan is required by ORS 430.630 and constitutes the basis for negotiation with the Oregon State Mental Health Division for the funding of mental health services in Washington County. Traditionally, this plan has included data from needs assessments, descriptions of existing service elements, and priorities for service development in each of the program areas: Administration, Alcohol (A), Drug (D), Developmental Disabilities (DD), and Mental and Emotional Disturbances (MED). Each program area, within the plan, contains: (1) at risk indicators and target populations in need of services, (2) program descriptions of existing mental health resources available to Washington County residents, (3) prioritized program development plans for meeting identified service delivery needs, and (4) a description of agencies and programs currently providing services as part of the Washington County Mental Health Program (subcontract agencies).

The Comprehensive Mental Health Plan for fiscal year 1976-1977, in addition to these traditional content areas, includes a series of management by objectives (MBO) budget packages. These management by objectives budget packages outline, by subcontract agency, by service element, by target population, how many families and individuals will be served in each service delivery area and at what cost to the program. The content of these management objectives represents a consolidation of information contributed by the mental health "specialists" (members of the administrative core staff) in each program area, members of community advisory groups, and directors and agency staff within each of the subcontract agencies (service providers).

Management objectives were submitted to the administrative core staff team by the heads of the various subcontract agencies. The administrative "specialists" in each program area then worked, with subcontract agency directors, to further define, modify, and interface these objectives. When the objectives were satisfactory to both parties, they were implemented as part of the MBO budget package peculiar to that subcontract agency. During this phase of developing management

٠.

objectives, a growing awareness and appreciation concerning the difficulty associated with the writing of clear, concise, easily measured service objectives served to promote and direct treatment planning energy and thought on the part of both subcontract agency personnel and Washington County administrators.

Many of the management objectives, developed for fiscal year 1976-1977, are weak (e.g., we will inform 30 percent of Washington County of local alcohol resources) in terms of specificity and measurability; others are well detailed (e.g., we will provide brief inpatient services for twenty county residents with MED problems). In general, objectives from the DD program area tend to be better written and easier to measure than those from administration, A, D, and MED program areas. There are many reasons for this, including the treatment modality most often employed in the DD program area (behavior modification), which most easily lends itself to quantifiable treatment evaluation approaches. In many instances, the DD program area format serves as a model for the other program areas. The administrative objectives tend to be the weakest, least measurable; this may be due, in part, to the fact that data, relevant to these objectives and required for follow-up, are not collected by the state management information system (MHIS) or in any other systematized manner.

The rationale behind and intent of the MBO approach is to hold each agency, involved in the Washington County Mental Health Program, responsible for negotiating and following through with a contract for service delivery that is easily defined, measurable, and mutually satisfactory to both agency director and Washington County Mental Health

Program area specialist. The MBO budget packages represent a purchase of treatment agreement similar to sales contracts prevalent in the business community. They are designed to promote fiscal accountability, greater visibility of treatment options, a clarity of purpose and direction within the mental health system, as well as support a more reliable method of tracking clients through service delivery elements.

Each agency, along with adopting an MBO budget package agreement, is required to collect and submit data (on a twice yearly basis), relating to the agreed-upon objectives, to the Washington County Mental Health Program Specialist in the appropriate program area. Data are submitted both through the State Mental Health Information System and through the agencies' own record keeping systems. Washington County Mental Health administrative staff members process the evaluation and feed it back to the agency directors with comment. In this manner, agency directors are held accountable for contracts which are not adequately upheld and may experience a modification in the amount of county funds available to them.

In the "Washington County Year End Report for Fiscal Year 1976-1977" (Chapter II of this practicum), data from both agency record keeping systems and MHIS, relating to the management by objectives budget packages outlined in the "Comprehensive Mental Health Plan," have been extracted, consolidated, and condensed in order to examine and contrast the projected and actual service utilization rates. This report was compiled, by this author, for use, by the Washington County Mental Health Program administrators, in renegotiating and refining subcontract agency MBO packages, in obtaining funding from the Washington County

Commissioners and in obtaining additional funding from the Oregon State Mental Health Division. In addition, it has been useful in serving to focus treatment efforts, defining treatment objectives, triggering cost/ benefit discussions, and tracking mental health client populations within the mental health system.

Chapter II of this practicum is the "Washington County Year End Report for Fiscal Year 1976-1977." Some problems are inherent in the nature and design of this type of evaluation as well as the available record keeping systems; they are discussed in Chapter III along with program implications arising from the utilization of this type of evaluation effort and recommendations for improvement in future evaluation activities of this kind.

CHAPTER II

WASHINGTON COUNTY MENTAL HEALTH PROGRAM YEAR END REPORT, FISCAL YEAR 1976-1977

COMPREHENSIVE PROGRAM NARRATIVE

The Washington County Mental Health Program served a total of 7,429 Washington County residents during the fiscal year 1976-1977. Three thousand one hundred thirty-eight were served through direct services, and 4,291 were served through indirect services. This is not an unduplicated count. The services were provided in four program areas: Alcohol, Drug, Developmental Disabilities, and Mental and Emotional Disturbances. County administrative staff coordinated the service delivery across program areas, was responsible for program administration, program development, preparation and monitoring of contracts, as well as program evaluation activities.

Eighteen service elements, or categories of service delivery, were provided in fiscal year 1976-1977. Direct service elements, involving face-to-face contact, are as follows, along with the number of clients served in each during the year.

2,081 Outpatient

19 Inpatient

84 24-hour Emergency "Beeper" Consultation

56 Substance Abuse-related Medical Treatment

38 TMR Preschool

119 TMR Classroom

64 MR/DD Adult Activity Center

10 Residential Treatment

52 Socialization and Day Treatment

14 Homemaker

587 Commitment and Diversion

14 Aftercare

Indirect service delivered, including consultation not requiring opening of a case, were as follows.

1,398 Information and Assistance

758 Outreach and Advocacy

1,965 Consultation and Education

170 Continuity and Coordination

Washington County contracted with eighteen local agencies or "subcontract agencies," to provide the above mental health services.

Below is a quantitative breakdown by program area. Again, the complication of duplications in the count arises; there is always the possibility that one person was served in more than one service element.

Alcohol Program

The Alcohol Program included seven subcontract agencies as well as the Washington County Alcohol Specialist. These agencies were: Substance Abuse Council, Tri-County Community Council, Washington County Youth Contact, Washington County Community Corrections, Native American Rehabilitation Association, Tualatin Valley Mental Health Center, and Centro Cultural. Two thousand forty-three individuals and families were served in eleven service elements, as follows.

329 Outpatient

21 24-hour Emergency "Beeper" Consultation

37 Substance Abuse-related Medical Treatment

469 Information and Assistance

330 Outreach and Advocacy

857 Consultation and Education

Three hundred eight-seven clients received direct services, and 1,656 clients received indirect services.

Drug Program

The Drug Program involved no subcontract agencies. The program incorporated CODA loan staff, HB 2145 resources, drug diversion resources, and the Washington County Drug Specialist and related staff. One thousand four hundred eighty individuals and families were served in seven service elements.

170 Outpatient

11 24-hour Emergency "Beeper" Consultation

19 Substance Abuse-related Medical Treatment

641 Information and Assistance

428 Outreach and Advocacy

63 Consultation and Education

148 Continuity and Coordination

Two hundred clients received direct services, and 1,280 clients received indirect services.

Developmental Disabilities Program

The Developmental Disabilities Program included seven subcontract agencies, as well as the Washington County Developmental Disabilities staff, and the County Child Development Program. These agencies were: Beaverton Preschool, Beaverton TMR, Forest Grove TMR, Good Shepherd TMR, Edwards Activity Center, Edwards Group Home, and TVW, Inc. One thousand twenty-five individuals and families were served in seven service elements.

13 24-hour Emergency "Beeper" Consultation

38 TMR Preschool

119 TMR Classroom

64 MR/DD Adult Activity Center

10 Residential Treatment

Information and Assistance (count not available)

781 Consultation and Education

Two hundred forty-eight clients received direct services, and 781 clients received indirect services.

Mental and Emotional Disturbances Program

The Mental and Emotional Disturbances Program included four subcontract agencies, as well as the Washington County MED Specialist, the Involuntary Commitment Program, a Brief Inpatient Program at Cedar Hills Hospital, and an Alternatives to Commitment Program. These MED agencies were: Lutheran Family Services, Metropolitan Family Services, Tualatin Valley Mental Health Center, and TVW, Inc. Day Treatment. Two thousand

five hundred ninety-three individuals and families were served in ten service elements.

1,582 Outpatient

- 19 Inpatient
- 39 24-hour Emergency "Beeper" Consultation
- 52 Day Treatment
- 14 Homemaker
- 587 Commitment and Diversion
- 14 Aftercare
- 288 Information and Assistance
- 264 Consultation and Education

. .

.

22 Continuity and Coordination

Two thousand two hundred ninety-seven clients received direct services, and more than 286 clients received indirect services.

CHAPTER III

CONCLUSIONS AND RECOMMENDATIONS

There are some benefits to this type of evaluation; the results indicate current service utilization rates and emphasize accountability at the agency level. As mental health systems move toward "purchase of service" agreements with local agencies, data of this sort will be invaluable when it comes to identifying which agencies to contract with for which services. In addition, the results are useful tools in lobbying efforts with the state legislature and other funding sources. It is easy to glean, from the Year End Report, what types of target populations are being served (and what types are not receiving adequate services) as well as which service elements are over/underutilized.

There are obvious limitations associated with this type of evaluation design. The first problem stems from the fact that it is not ongoing, in the sense that there is no continual recycling of information, but rather a once-a-year report. Although the CL-1 reports are actually written two times a year, this also is not frequent enough, in the opinion of this author, to be termed ongoing evaluation. Although the reports are useful to the program director, the actual service providers receive little if any information concerning their daily activities. The information that they do receive is not imparted with a program remodeling flavor but rather an after-the-fact spirit. One would expect a good evaluation system to provide service delivery agents with regular information concerning the treatment (and effects of that treatment) that they are providing. Further, the information would be imparted at closer intervals (weekly, monthly, quarterly) in order that it could be useful in terms of decision making at many levels (therapist, agency, program).

1

At this point the only form of ongoing evaluation, taking place with any degree of regularity and designed to be responsive to the professional needs of the service delivery staff, is peer review and utilization review. Both of these evaluation activities are sporadic, nonsystematic, and are often perceived as punitive in nature rather than educational (as is their intent).

MHIS

Another problem associated with the CL-1 and annual reports relates to the validity and reliability of the data collection system. The MHIS, a statewide service available to all public local mental health programs, has serious drawbacks. The CL-1 form itself, which is <u>the</u> data collection instrument as far as the state MHIS is concerned, is outdated, dysfunctional, unreliable and, at best, incomplete. A copy of this form has been included in this research practicum for purposes of illustration. It will be found in the Appendix.

The form is often not filled out accurately by the service deliverers. Many of these clinicians approach the CL-1 form as a worthless chore that only detracts from the amount of time they could put to use in actual service delivery, a folly of the administration. Most of the data that are collected do not correspond to issues that the service

providers are concerned with, such as the efficacy of treatment models, the relative success of their personal approaches, etc. Many providers fill out the form in a standard way for each of their clients, noting no differences between clients with regard to diagnosis, the progression of treatment and outcome; many do not ever complete the CL-1 form for their clients. Thus, at the very base level, the foundation of the information system, the information going into the MHIS is incomplete and frequently inaccurate.

There are also structural problems with the form. For example, it seems unrealistic to break client income down by intervals of \$1,000; most clients find it difficult if not impossible to estimate income with that degree of accuracy. Beyond that, what real, significant difference is there between a client earning \$6,000 a year and a similar client earning \$7,000 a year in 1977? A revision of such structural problems associated with the CL-1 form is long overdue.

Yet another source of frustration associated with the state MHIS is the type of information collected. Most service providers and administrators alike plead to have "number of dependents," "source of income," and "marital status" indicators replaced with indicators that will reflect the outcome of treatment. As the CL-1 form stands, much may be extracted regarding the quantity of treatment and little may be said concerning the quality of treatment. Thus the MHIS dictates process evaluation not outcome evaluation.

ALTERNATIVES TO MHIS

During the past year, the Washington County Mental Health Program has sought alternatives to the state MHIS. They have seriously considered depending less upon the state MHIS and creating their own information system. Money was budgeted for a private consulting firm to examine the program, including evaluation needs, and to draft a model for a new information system. This model is now in the hands of Washington County mental health administrators. The major considerations associated with the move from the state MHIS to the new model can be boiled down to: "It is more cost effective (cheaper) to stay with the state system" versus "It is more valuable, in terms of quality of treatment, to go with the new model." This issue is currently under close examination; however, no decision has been made. Other counties in Oregon have made the decision to develop and implement their own information systems and have capitalized by gaining a more program responsive evaluation model.

DECISION-MAKING PROCESS

Returning to the CL-1 reports and the annual reports and looking at the decision-making structure in Washington County Mental Health, it must be reemphasized that, while other options are being considered, these reports are presently the major evaluation actitivites conducted within the agency. The results concluded in these studies, therefore, as they relate to the MBOs, will determine future funding for the program from both state and local funding sources. These results will also be the basis for future modifications within the program as reflected in

the further development and refinement of management objectives. The administrative staff will seek to modify these objectives in order to more closely approximate a 100 percent meeting of treatment objectives and actual treatment. For example, if one treatment objective reads, "We will provide brief inpatient treatment for twenty Washington County residents," and only ten residents actually received this service, representing only a 50 percent achievement of the original objective, then the objective will be revised the following year. In some cases the objective will remain the way it is and the treatment approach will be revised. The goal is always a 100 percent match between projected goals and actual services delivered. As the evaluation system grows and is refined, it will become easier to control discrepancies.

Decision making comes mostly from the top down with some input, on treatment-related issues, from the service providers. The leverage point, as far as decision making is concerned, is based on funding, money. The people to be satisfied, as far as evaluation results are concerned, are the funding sources, the people with the money.

As most of the treatment providers in the county system are private and private-nonprofit agencies, subcontracted with Washington County Mental Health to provide specific services, their decision-making structures are discrete. Insofar as they are under contract with the county system, they are subject to accountability regarding their adherence to mutually agreed-upon treatment and management objectives. A subcontract agency that repeatedly fails to meet outlined objectives may not be as generously funded the following year.

RECOMMENDATIONS FOR CHANGE

While still hooked into the state MHIS, it is possible to implement some changes in evaluation procedures. It is recommended that the following changes be investigated: (1) a move toward more frequent cycling of program evaluation information (weekly, monthly, quarterly), (2) an attempt to engage more service providers in evaluation activities and the decision-making procedures, (3) a move toward more inhouse evaluation activities (should the three needs assessments have been conducted by agency staff members, benefits such as familiarity with client populations would not have been sacrificed), (4) an attempt to present peer review and utilization review in a less threatening manner that will be more valuable to the clinicians, and (5) a consistent and concerted effort to link evaluation activities to specific decisions to avoid unnecessary wasted energy and paperwork.

As a more long-term goal, implementation of a management information system that is more responsive to the local programs is recommended. This new information system may permit the following evaluation changes to occur: (1) a development and recording of more treatmentoriented criteria (as opposed to demographic data only), (2) a development and recording of outcome data reflecting quality of treatment (as opposed to quantity of treatment only), and (3) an information recycling system that provides information to professionals at all treatment levels (as opposed to administration only).
